Working Prototype Known Problems Report

BitBoard

Francisco Braga, Matthew Cruz, Haonan Xu, Guita Vahdatinia, Josh Stern

11/30/17

List of functions not working correctly
1. It takes a long time to load the cryptocurrency page with all the prices.
   a. This is because we are making many database calls
   b. We have tried to limit the calls by not having all of the currencies load at the same time.
      i. Did not work because it was very complicated to do and would never be finished by the end of the sprints.
      ii. We tried to get a faster api but the only one that was free was the slowest one.
2. Database for the news is not automatically refreshed.
   a. We do not know exactly how to fix this.
      i. Currently we have to docker-compose down and docker-compose up in order to refresh the news.
3. Profile page is not hooked up to the database.
   a. What currently exists is a prototype/backbone for a profile page.
   b. No options to currently more information to the profile page.
   c. The watch (+) buttons and read (+) later buttons don't add the items to the profile model.
   d. We changed our priority to polish our product because the deadline was approaching and we had to focus on adding unit tests.
   e. There isn't an option to edit user information.
4. Table only loads the top 100 cryptocurrencies.
   a. The database has all of the coins, but the table isn't showing it currently.
5. On the signup page, the information on how to create a password is messed up because the built in Django signup/login information is incorrect.
   a. To change it we would have to manually override the signup database feature and that was not a priority.
   b. Additionally the margins are not aligned correctly on these pages when the web browser isn't full screen.
   c. The text of the signup page has errors that we are unable to change because it is built in with Django.
6. The logout page says that you are logged out successfully every time.
   a. Even if you are not logged in to the site it says that you are currently logged in.
